

RMB since 1985

RMB

**The thin balance between
environment and development.**

RMB is specialized in metal scrap recovery, an activity which has always been the guiding principle of this company that aims at respecting and protecting both the environment and the inhabitants of its own territory.

The management of the whole production cycle, the working process control, the technical innovation, our new industrial plants and the new certification, all testify to our commitment.

The fine flagship of our activity is the floatation system, whose efficiency has been improved all over the years till we finally reached an efficient separation and valorization of aluminum fractions. We process around 30.000 tons per year of mixed metals coming from many different European countries, in the case at issue Poland is one of our biggest foreign suppliers. All kind of aluminium alloy we recover is then reused.

The other metals are called "the heavies" and they are mainly composed by zinc alloys, brass and copper. These fractions are sold both on the domestic and on the international market where they still represent an important source of secondary raw materials for final users. What makes RMB unique is its production cycle, with an attempt to reduce the environmental impact.
